1. Module Definition DTD v1.0

1.1. Purpose

This DTD was developed to define the modules of the Nord Modular synthesizer and their hierarchy.

Note:

Any information represented in the XML file is independent of the language you chose for programming. The definitions of substitutions are not directly included into this DTD as they may contain language dependent information like class-names.

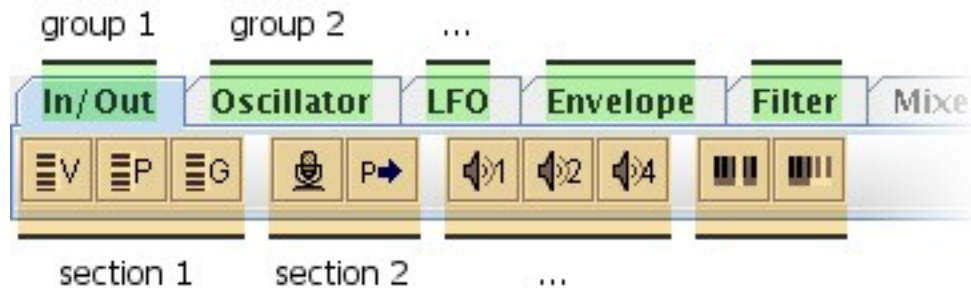

1.2. Structuring Modules

Along with defining the attributes of a single module this DTD supports adding information about how they relate to each other and how they are grouped.

Example: (contained elements: [structure](#), [group](#), [section insert](#))

```
<structure>
  <group name="In/Out">
    <section>
      <insert module-id="1" />
      <insert module-id="63" />
      <insert module-id="65" />
    </section>
    <section>
      <insert module-id="2" />
      <insert module-id="127" />
    </section>
    ...
  </group>
  ...
</structure>
```

The provided structure can be used to generate the following tabbed pane.

[figure:tabbedpane - groups and sections]

- Each 'group'-element is mapped to a tab-group in the same order found in the xml file.
- The 'section'-element groups modules inside a tab. Two sections should be separated by a space.
- Modules inside a section should appear in the tab in the same order found in the xml file.

1.3. Proposal for new versions

The substitutions have to be better integrated. For example on an oscillator-module the frequency value (and with that it's substitution) depends on the states of frequency-display, coarse and fine. In this version of the DTD supports no substitutions that have more than one variable.

All possible names for a substitution should be defined in this DTD.

Language-independent substitutions for the values of a parameter should be defined in this DTD. (for example simple string-substitutions like: 0='Off',1='On')

Substitutions now threaded as language-depended, such that have to be calculated (for example the Oscillator's frequency) might be represented in the xml file as well. This could be realized as shown in the next example. (a similar substitution can be found in the substitutions DTD)

```
<substitution name="example-transformation">
  <transform
    offset      = "0"      <!-- default:0 , shortcut:o -->
    factor      = "1.0"    <!-- default:1.0, shortcut:f -->
    prefix-string = "x"    <!-- default:"" , shortcut:p -->
    suffix-string = "[UNIT]" <!-- default:"" , shortcut:s -->
  />
</substitution>
```

represents the transformation:

$$t_{o,f,p,s} := \begin{cases} int & \longrightarrow string \\ value & \longrightarrow concatenate(prefix, (value + offset) \cdot factor, suffix) \end{cases}$$

[figure:example transformation]

There could be an 'optional'-element containing optional information about a module. For example it could contain layout related definitions such as how elements should be grouped. For example

- coarse - fine - frequency-display belong together
- in- or outputs often belong to an additional level-knob

This would definately increase the development time required to generate custom themes.

Simply because

- grouped elements can automatically be positioned together
- more user interface components can be generated automatically for example grouped elements could be put into a groupbox. Also text/icon-labels (where reasonable).

1.4. Object Model

[figure:mapping]

1.5. modules-definition-v10.dtd - Reference

1.5.1. Top-level element(s)

- modules-definition

1.5.2. List of elements

- group
- input
- insert
- module
- modules
- modules-definition
- output
- parameter
- section
- structure
- true

1.5.3. Element declarations

| | | |
|----------------|---|-------------|
| group | | |
| Content model: | (section +) | |
| Used inside | structure | |
| Attributes: | name | type: CDATA |
| | short-name | type: CDATA |
| | Optional attribute which must contain a shortcut for attribute 'nam | |

| | | |
|----------------|---|---|
| | 'name' contains more than eight characters. | |
| input | | |
| Content model: | EMPTY | |
| Used inside | module | |
| Attributes: | id | type: NMTOKEN |
| | The id's value is equivalent to the index of an element defined by inputs with indices 0 and 1 must have an id with the same values | |
| | name | type: CDATA |
| | type | possible values: audio, control, logic, slave |
| insert | | |
| Content model: | EMPTY | |
| Used inside | section | |
| Attributes: | module-id | type: NMTOKEN |
| | The id of a module. A module with same id must be defined inside | |
| module | | |
| Content model: | (custom input output parameter) * | |
| Used inside | modules | |
| Attributes: | id | type: NMTOKEN |
| | The id's value is equivalent to the index of an element defined by inputs with indices 0 and 1 must have an id with the same values | |
| | short-name | type: CDATA |
| | cva-only | possible values: true, false |
| | This attribute is only used in the PolyAreaIn module. Its value is fa | |

| | |
|--|---|
| | only to be specified if it should have 'true' as value. |
| limit | type: NMTOKEN |
| | Defines a limit of how many times a module is available in one pa means that the number of this module is not limited. |
| cycles | type: NMTOKEN |
| | |
| dyn-mem | type: NMTOKEN |
| | |
| height | type: NMTOKEN |
| | |
| prog-mem | type: NMTOKEN |
| | |
| x-mem | type: NMTOKEN |
| | |
| y-mem | type: NMTOKEN |
| | |
| zero-page | type: NMTOKEN |
| | |
| modules | |
| Content model: | (module +) |
| Used inside | modules-definition |
| Attributes: | - none - |
| modules-definition (top-level element) | |
| Content model: | (structure , modules) |
| Used inside | - none - |
| Attributes: | - none - |
| output | |
| Content model: | EMPTY |
| Used inside | module |

| | | |
|----------------|---|---|
| Attributes: | id | type: NMTOKEN |
| | The id's value is equivalent to the index of an element defined by inputs with indices 0 and 1 must have an id with the same values | |
| | name | type: CDATA |
| | type | possible values: audio, control, logic, slave |
| parameter | | |
| Content model: | EMPTY | |
| Used inside | module | |
| Attributes: | id | type: NMTOKEN |
| | The id's value is equivalent to the index of an element defined by inputs with indices 0 and 1 must have an id with the same values | |
| | name | type: CDATA |
| | min | type: NMTOKEN |
| | The smallest possible value. If the attribute is missing it implies a | |
| | max | type: NMTOKEN |
| | The largest possible value. | |
| | default | type: NMTOKEN |
| | The default value. This should be used to set the state of a parameter instantiated. | |
| | bit-count | type: NMTOKEN |
| | Number of bits reserved for the value. (expected by the protocol) | |
| | use-substitution | type: CDATA |
| | Contains an identifier for the substitution that should be used to get the parameter's raw value. A missing 'use-substitution' attribute implies to its substitution. This simply means that for example the number | |

| | | | |
|---|--|---|--|
| | | (Find out more about substitutions.) | |
| section | | | |
| Content model: | (insert +) | | |
| Used inside | group | | |
| Attributes: | - none - | | |
| structure | | | |
| Content model: | (group +) | | |
| Used inside | modules-definition | | |
| Attributes: | - none - | | |
| true | | | |
| Substitutions are not supported in this DTD version for element 'custom'. | | | |
| Content model: | EMPTY | | |
| Used inside | - none - | | |
| Attributes: | id | type: NMTOKEN | |
| | min | type: NMTOKEN | |
| | The smallest possible value. If the attribute is missing it implies a | | |
| | max | type: NMTOKEN | |
| | The largest possible value. | | |
| | default | type: NMTOKEN | |
| | The default value. This should be used to set the state of a param instantiated. | | |
| | bit-count | type: NMTOKEN | |
| | Number of bits reserved for the value. (expected by the protocol) | | |

2. Substitution DTD v1.0

2.1. Purpose

The idea behind substitutions is to XMLize the transformation from a parameter's numeric representation to its string-representation. This has several convenient advantages:

- less information must be included in source code
- automated linking of substitutions and parameters

2.2. Proposal for new versions

See the "[Proposal for new versions](#)"-section.

2.3. substitutions-v10.dtd - Reference

2.3.1. Top-level element(s)

- substitutions

2.3.2. List of elements

- if
- item
- list
- substitutions
- transform
- use-implementation

2.3.3. Element declarations

| | | |
|---|---------------------------|---------------|
| if | | |
| If a parameter's value is equal to attribute 'value-is', 'replace-with' supersedes the superior substitution. | | |
| Content model: | EMPTY | |
| Used inside | transform | |
| Attributes: | replace-width | type: CDATA |
| | value-is | type: NMTOKEN |

| | | | | | | | |
|---|---|----|----------|--------------------------|--|--------|---------------|
| item | | | | | | | |
| Content model: | (#PCDATA) | | | | | | |
| Used inside | list | | | | | | |
| Attributes: | - none - | | | | | | |
| list | | | | | | | |
| Contains a list of strings. The parameters value is used as index to an 'item' element where the 0 is the index for the first item, 1 is the index for the second item, | | | | | | | |
| Content model: | item + | | | | | | |
| Used inside | substitutions | | | | | | |
| Attributes: | <table border="1"> <tr> <td>id</td> <td>type: ID</td> </tr> <tr> <td colspan="2">Name of the substitution</td> </tr> </table> | id | type: ID | Name of the substitution | | | |
| id | type: ID | | | | | | |
| Name of the substitution | | | | | | | |
| substitutions (top-level element) | | | | | | | |
| Content model: | (transform + , use-implementation + , list +) | | | | | | |
| Used inside | - none - | | | | | | |
| Attributes: | <table border="1"> <tr> <td>id</td> <td>type: ID</td> </tr> <tr> <td colspan="2">Name of the substitution</td> </tr> </table> | id | type: ID | Name of the substitution | | | |
| id | type: ID | | | | | | |
| Name of the substitution | | | | | | | |
| transform | | | | | | | |
| This element defines the transformation $t(\text{value}) := \text{concatenate}(\text{prefix}, (\text{value}+\text{offset})\text{-factor}, \text{suffix})$. If element 'if' matches value, it supercedes the transformation $t(\text{value})$. | | | | | | | |
| Content model: | if ? | | | | | | |
| Used inside | substitutions | | | | | | |
| Attributes: | <table border="1"> <tr> <td>id</td> <td>type: ID</td> </tr> <tr> <td colspan="2">Name of the substitution</td> </tr> <tr> <td>factor</td> <td>type: NMTOKEN</td> </tr> </table> | id | type: ID | Name of the substitution | | factor | type: NMTOKEN |
| id | type: ID | | | | | | |
| Name of the substitution | | | | | | | |
| factor | type: NMTOKEN | | | | | | |

| | | |
|--|---|---------------|
| | offset | type: NMTOKEN |
| | prefix | type: CDATA |
| | suffix | type: CDATA |
| use-implementation | | |
| This element links a custom implementation with a parameter. | | |
| Content model: | EMPTY | |
| Used inside | substitutions | |
| Attributes: | id | type: ID |
| | Name of the substitution | |
| | class | type: ID |
| | Identifier for the custom implementation. | |
